

AIRLINE TRAINING SLIDE/RAFT

Boeing 747 / Airbus A340 Training Slide

Tulmar training slides are made of robust materials and reinforced at all contact points making them considerably more durable for training than OEM slides. Our slides have extended side rails to guard against injury while training. The slide floors are aluminized to prevent the effects of static charging when sliding. All materials are fire retardant. Tulmar slides can be used in pool training because we use materials more resistant to chlorine than OEM slides. Should the floor need replacing, we can supply at minimal cost an additional floor that attaches over the original floor with Velcro. Tulmar can design training slides to customer requirements for length, number of lanes and usage. They can be made similar to slide/rafts used for large aircraft, such as the Boeing 747 or the A340, and can be used either for slide training or pool training.

Tulmar Safety Systems Inc is ISO 9002 certified

Materials

- Chambers are made from 20-oz/sq.yd 420-denier nylon coated with neoprene on one side and grey Hypalon™ on the other side.
- Neoprene seam tape is used for reinforcement.
- Floor fabric is fire retardant conductive polyether polyurethane and meets TSO C69a.

Standard Accessories

- inlet and relief valves as necessary
- simulated girt bar designed for customer requirements
- deceleration strips for sliding surfaces
- hand lines and webbing for lifting
- all stabilizing chambers where applicable
- patch kit.

Optional Accessories

• aspirators	• sea anchor
• survival kit	• dummy ELT and antennas
• survival knife	• hand pump and valves
• mooring line	• valise for slide
• boarding ladder	• oral tubes
• sea lights	• additional floor
• lighting strips	
• canopy
